                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 18, Application US/08393985
Patent No. 5693476
GENERAL INFORMATION:
APPLICANT: Scheller, Richard H.
TITLE OF INVENTION: Methods and Compositions for Modulation
TITLE OF INVENTION: of Vesicular Release
NUMBER OF SEQUENCES: 35
CORRESPONDENCE ADDRESS:
ADDRESSER: Dehlinger & Associates
STREET: 350 Cambridge Avenue, Suite 250
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                        Sequence 18, Application US/08743894B

Sequence 18, Application US/08743894B

Sequence 18, Application US/08743894B

Patent No. 5965699

GENERAL INFORMATION:
APPLICANT: Ages 3 Schmidt

APPLICANT: Ages 4 Schmidt

TITLE OF INVENTION: Assay for the Proteolytic Activity of Serotype A Neurotoxin fr

NUMBER OF SEQUENCES:
ADDRESSEE: MCMR-JA Atn:John Moran-Patent Atty
STREET: USA MRMC - 504 Scott Street
CTTY: FORT DETRICK
STRATE: MARYLAND
COUNTRY: USA
ZIP: 21702-5012

Patent No. 565599
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: James J. Schmidt
APPLICANT: Karen A. Bostian
TITLE OF INVENTION: Assay for the Proteclytic Activity of Serotype A Neurotoxin fr
NUMBER OF SEQUENCES: 56
CORRESPONDENCE ADDRESS:
ADDRESSEE: MCMR-JA Attn:John Moran-Patent Atty

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

TITLE OF INVENTION: GFP-SANP25 Fluorescence Release Assay
TITLE OF INVENTION: For Botulinum Neurotoxin Protease Activity
FILE REFERENCE: 66872-044
CURRENT APPLICATION NUMBER: US/10/917,844
CURRENT FILING DATE: 2004-08-13
PRIOR PLING DATE: 2001-08-28
NUMBER OF SEQ ID NOS: 113
SEQ ID NO 38
LENGTH: 33
LENGTH: 33
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         OTHER INFORMATION: Description of Artificial Sequence: Synthetic OTHER INFORMATION: peptide

                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 8, Application US/08819286

Patent No. 6169074

GENERAL INFORMATION:
APPLICANT: Montal, Mauricio
TITLE OF INVENTION: PEPTIDE INHIBITORS OF
TITLE OF INVENTION: PEPTIDE INHIBITORS OF
TITLE OF INVENTION: DEBROTRANSMITTER SECRETION BY NEURONAL CELLS
NUMBER OF SEQUENCES: 29
CORRESPONDENCE ADDRESS:
ADDRESSEE: TSIA & RIChardson P.C.
STREET: 4225 Executive Square, Suite 1400
CITY: La Jolla
                                                                                                                    Sequence

Event=Alternative splicing; Named isoforms=2; Comment=1soforms differ by the usage of two alternative homologous exons (5a and 5b) which encode for positions 56 to 94 and differ only in 9 positions out of 39;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SUBDAIT: Part of the SNARE core complex containing SNAP25, VAMP2 and STXIA. This complex binds CPLXI. Interacts with TRIM9, RIMS1 and SNAP25BP. Binds STXBP6. Found in a ternary complex with STXIA and VAMP8 (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SNP25 CHICK STANDARD; PRT; 206 AA.

"Three-dimensional structure of the complexin/SNARE complex."; neurotransmitter release. May play an important role in the synaptic function of specific neuronal systems. Associates with proteins involved in vesicle docking and membrane fusion. SUBUNIT: Part of the SNARE core complex containing SNAP25. VAMP2 and STAIA. This complex binds CPLAI. Interacts with TRIM9, RIMS1, SNAP25BP and HGS. Binds STXBP6. Found in a ternary complex with STXIA and VAMP8 (By similarity). GO: 000726; P:neurotransmitter secretion, NAS.
GO: 000726; P:neurotransmitter uptake; NAS.
GO: GO:00050796; P:nequlation of insulin secretion; TAS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               94
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MEDLINE=2347237; PubMed=12459461; DOI=10.1016/S0014-5793(02)03629-3; Hepp R., Cabaniols J.P., Roche P.A.; "Differential phosphorylation of SNAP-25 in vivo by protein kinase C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          neurotransmitter release. May play an important role in the synaptic function of specific neuronal systems. Associates with proteins involved in vesicle docking and membrane fusion. Subsurir: Part of the STARE core complex containing SNAP25, vAMP2 and STXIA. This complex binds CPLXI. Interacts with TRIM9, RIM81, STXIA and VAMP8 (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Event-Alternative splicing; Named isoforms-2; Comment-Isoforms differ by the usage of two alternative homologous exons (5a and 5b) which encode for positions 56 to and differ only in 9 positions out of 39;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and protein kinase A.";

```
The present invention relates to novel clostridium toxin substrates. The invention further relates to botulinum serotype A/E (BONT/A/E) substrates which comprise a donor fluorophore, an acceptor having an absorbance appetrum overlapping the emission spectrum of the donor fluorophore and abont A or BONT/E recognition sequence comprising a cleavage site, where the cleavage site intervenes between the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the procease activity of any clostridial toxin including bacterial, baculoviral and yeast toxins (TeNT) in a sample including bacterial, baculoviral and yeast samples of the invention of processed foods, beverages, animal feed, soil
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                         samples, water samples, cosmetics, tissue samples and beverage or food samples. They are useful to assay a sample from a human or animal, for e.g., exposed to clostridial toxin or having one or more symptoms of a clostridial toxin, to follow activity during production and purification of clostridial toxin and to assay formulated clostridial toxin products including pharmaceuticals and cosmetics. The present sequence is fret substrate peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "Tetramethylrhodamine labelled lysine; C-terminal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    suppressonal associated protein (SNRP-25), and is a inhibitory agent of the invention. The agents of the invention inhibit secretion of the invention. The agents of the invention inhibit secretion of unconcensuiter from neuronal cells and is an excitation-secretory uncoupling peptide (I) of at least 20 amino acids (aa) all of which correspond substantially to any one of AAW30097-W30102, or more generally any (I) that inhibits 50% of catecholamine secretion from bovine chromaffin cells at a concentration of 10 microM, especially 0.25 microM, or less. (I) are used, as a replacement for Clostridium toxin, to inhibit release of neurotransmitters from synaptic vesicles, specifically for reducing muscle spasticity. Also (I) may be labelled to allow in vivo imaging of intracellular distribution of (I). Compounds for delivering substance P to brain tumours for induction of apoptosis. Unlike the neurotoxins, (I) are not toxic or immunogenic and are more readily
                                                           assaying for the protesse activity of any clostridial toxin including toxins of all serotypes as well as tetanus toxins. The present sequence is FRET (flourescence resonance energy transfer) substrate to analyse proteclytic activity of botulinum toxin. This substrate is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Neurotransmitter secretion; inhibitor; neuronal cell; synaptic vesicle; excitation-secretory uncoupling peptide; catecholamine secretion; bovine chromaffin cell; Clostridium toxin; muscle spasticity reduction; synaptosomal associated protein; SNAP-25.
                                                   The present invention provides clostridial toxin substrates useful in
                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Excitation-secretory uncoupling peptide(s) for inhibiting nuscle neuro:transmitter release - used particularly for treating muscle spasticity, and for delivering drugs specifically to neural cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequence corresponds to residues 181-206 of the human 25 kD

The present invention relates to novel clostridium toxin substrates. The invention further relates to botulinum serotype A/B (BoNT/A/B) substrates which comprises a donor fluorophore, an acceptor having an absorbance pectrum overlapping the emission spectrum of the donor fluorophore and a pectrum of clasavage site intervenes between the donor fluorophore and acceptor the clasavage site intervenes between the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurocoxins include VAMP (synaptobrevin), SMAP-25 and syntaxin. Sequences of the invention are useful in assaying for the protease activity of any clostridial toxin including botulinum toxins of all serotypes and tetanus toxins (TeWT) in a sample including bacterial, baculoviral and yeast typate, raw, cooked or processed foods, beverages, animal feed, soil samples, water samples, cosmetics, tissue samples and beverage or food samples. They are useful to assay a sample from a human or animal, for Botulinum serotype A/E substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     spectrum overlapping the emission spectrum of the donor fluorophore and a BoNT A or BoNT/E recognition sequence comprising a cleavage site, where BONT A or BONT/E recognition sequence comprising a cleavage site, where the cleavage site intervenes between the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the protease activity of any clostridial toxin including beculinum toxins of all serotypes and teranus toxins (TeNT) in a sample including bacterial, baculoviral and yeast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Botulinum serotype A/E substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel clostridium toxin substrates. The invention further relates to botulinum serotype A/E (BONT/A/E) substrates which comprise a donor fluorophore, an acceptor having an absorbance
e.g., exposed to clostridial toxin or having one or more symptoms of a clostridial toxin, to follow activity during production and purification of clostridial toxin and to assay formulated clostridial toxin products including pharmaceuticals and cosmetics. The present sequence is goldfish
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Goldfish; clostridium toxin; protease activity; botulinum toxin; BONT; tetanus toxin; VAMP; synaptobrevin; SNAP-25; syntaxin; pharmaceutical;

The invention further relates to botulinum serotype A/B (BONT/A/B) substrates which comprise a donor fluorophore, an acceptor having an absorbance spectrum overlapping the emission spectrum of the donor fluorophore and a BoNT A or BONT/B recognition sequence comprising a cleavage site, where the cleavage site intervenes between the donor fluorophore and acceptor and under the appropriate conditions, the resonance energy transfer is
lysate, raw, cooked or processed foods, beverages, animal feed, soil samples, water samples, cosmetics, tissue samples and beverage or food samples. They are useful to assay a sample from a human or animal, for e.g., exposed to clostridial toxin or having one or more symptoms of a clostridial toxin, to follow activity during production and purification of clostridial toxin and to assay formulated clostridial toxin products including pharmaceuticals and cosmetics. The present sequence is goldfish
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Botulinum serotype A/E substrate useful for assaying protease activity of botulinum toxins, comprises donor fluorophore, acceptor and a clostridial toxin recognition sequence that includes a cleavage site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, clostridium toxin, protease activity, botulinum toxin, BoNT; TeNT,

exhibited between the donor and acceptor. Natural targets of clostridium neurotoxins include VAMP (synaptobrevin), SNAP-25 and syntaxin. Sequences of the invention are useful in assaying for the processe activity of any clostridial toxin including botulinum toxins of all serotypes and tetamus toxins (TeNT) in a sample including bacterial, baculoviral and yeast lysate, raw, cooked or processed foods, beverages, animal feed, soil samples, water samples, cosmetics, tissue samples and beverage or food samples. They are useful to assay a sample from a human or animal, for e.g., exposed to clostridial toxin or having one or more symptoms of a clostridial toxin, to follow activity during production and purification of clostridial toxin and to assay formulated clostridial toxin products including pharmaceuticals and cosmetics. The present sequence is SNAP-25 peptide used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Determining clostridial toxin protease activity, by treating sample with clostridial substrate with donor fluorophore, acceptor, toxin recognition sequence, under conditions which exhibit resonance energy transfer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides clostridial toxin substrates useful in assaying for the protease activity of any clostridial toxin including toxins of all serotypes as well as tetanus toxins. The present sequence is goldfish SNAP-25B BONT/A (botulinum neurotoxin serotype A) cleavage

Determining clostridial toxin protease activity, by treating sample with clostridial substrate with donor fluorophore, acceptor, toxin recognition sequence, under conditions which exhibit resonance energy transfer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides clostridial toxin substrates useful in assaying for the protease activity of any clostridial toxin including toxins of all serotypes as well as tetanus toxins. The present sequence is goldfish SNAP-25A BONT/A (botulinum neurotoxin serotype A) cleavage site peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Determining clostridial toxin activity, comprises contacting cell with sample comprising substrate with donor fluorophore, acceptor and recognition sequence, exciting fluorophore, and determining resonance energy transfer of contacted cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               clostridial toxin; fluorophore; clostridial toxin product; BOTOX; food.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Botulinum toxin substrate recognition sequence #39.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 109; DB 7;

The invention relates to a method of determining (MI) clostridial toxin activity, comprising contacting cell with sample comprising clostridial activity, comprising contacting cell with sample comprising clostridial coxin measurements. (A) with an absorbance spectrum overlapping emission spectrum of fluorophore clostridial toxin recognition sequence with cleavage site intervening clostridial toxin recognition sequence with cleavage site intervening transfer is exhibited between fluorophore and acceptor, exciting the contacted cell relative to a control cell, where a difference in resonance energy transfer of the contacted cell is indicative to a control cell, where a difference in resonance energy transfer of the contacted cell as compared to the contact cell is indicative of clostridial toxin activity. (MI) is useful for determining clostridial toxin activity, where the sample is a crude cell lysate, isolated clostridial toxin, formulated clostridial toxin product, BOTOX or food. (MI) is an automated high-throughput assay. (MI) reduces the need for animal toxicity studies and serves to analyze multiple toxin functions such as binding a cellular uptake of the toxin, translocation into the cell cytosol and protease activity. In the method MI, the clostridial toxin substrate is a botulinum toxin substrate comprising a BONT/A, BONT/B, BONT/E, BONT/F, BONT/C, BONT/F, Corresponds to a recognition sequence for a botulinum toxin used as the clostridial Disclosure; SEQ ID NO 60; 188pp; English coxin substrate

```
donor fluorophore, and determining resonance energy transfer of the contacted cell relative to a control cell, where a difference in resonance energy transfer of the contacted cell as compared to the control cell is indicative of clostridial toxin activity. (MI) is useful for determining clostridial toxin activity, where the sample is a crude cell lysate, isolated clostridial toxin, formulated clostridial toxin product, BOTOX or food. (MI) is an automated high-throughput assay. (MI) reduces the need for animal toxicity studies and serves to analyze contitiple toxin functions such as binding a cellular uptake of the toxin, translocation into the cell cytosol and protease activity. In the method MI, the clostridial toxin subserate is a botulinum toxin substrate selected from a BOMT/A, BOMT/B, BOMT/C, BOMT/F, BOMT/F, BOMT/G or TeMT substrate comprising a BOMT/A, BOMT/B, BOMT/C, BOMT/B, BOMT/C, BOMT/C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of determining (M1) clostridial toxin activity, comprising contacting cell with sample comprising clostridial toxin substrate with donor fluorophore (F), acceptor (A) with an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Determining clostridial toxin activity, comprises contacting cell with sample comprising substrate with donor fluorophore, acceptor and recognition sequence, exciting fluorophore, and determining resonance energy transfer of contacted cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         clostridial toxin; fluorophore; clostridial toxin product; BOTOX; food
The invention relates to a method of determining (MI) clostridial toxi activity, comprising contacting cell with sample comprising clostridia toxin substrate with donor fluorophore (F), acceptor (A) with an absorbance spectrum overlapping emission spectrum of fluorophore clostridial toxin recognition sequence with cleavage site intervening between (F) and (A), where under appropriate conditions resonance transfer is exhibited between fluorophore and acceptor, exciting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 33;

```
absorbance spectrum overlapping emission spectrum of fluorophore clostridial toxin recognition sequence with cleavage site intervening between (F) and (A), where under appropriate conditions resonance transfer is exhibited between fluorophore and acceptor, exciting the donor fluorophore, and determining resonance energy transfer of the contacted cell relative to a control cell, where a difference in contacted cell relative to a control cell, where a difference in contacted cell is indicative of the contacted cell as compared to the contact cell lysate, isolated clostridial toxin activity. Where the sample is a crude cell tysate, isolated clostridial toxin, formulated clostridial toxin crudices the need for animal toxicity studies and serves to analyze reduces the need for animal toxicity studies and serves to analyze controling functions such as binding a cellular uptake of the toxin, the clostridial toxin substrate is a botulinum toxin substrate of the toxin, selected from a BowT/A, BowT/B, BowT/F, BowT/F,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              toxin substrate.

Determining clostridial toxin protease activity, by treating sample with tagged toxin substrate comprising fluorescent protein, first and second partner of affinity couple and assaying fluorescent cleavage product in treated sample.

Disclosure; SEQ ID NO 37; 97pp; English.

activity of clostridial neurotoxins such as boulinum neurotoxin (BoNT) and tetanus neurotoxin (TeNT). The method involves treating with a sample, in solution phase under conditions suitable for clostridial toxin procease activity, a tagged toxin substrate (e.g. SNAP-25, VAMP, syntaxin) comprising fluorescent protein, first partner of affinity present invention relates to a method for determining protease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for determining protease activity of clostridial neurotoxins such as borulinum neurotoxin (BoNT) and tetanus neurotoxin (TaNT). The method involves treating with a sample, in solution phase under conditions suitable for clostridial toxin protease activity, a tagged toxin substrate (e.g. SNAP-25, VAMP, syntaxin) comprising fluorescent protein, first partner of affinity couple and clostridial toxin recognition sequence comprising cleavage site; contacting treated sample with second partner of affinity couple; and assaying presence of fluorescent cleavage product in the treated sample. The present sequence is the goldfish SNAP-25 substrate BoNT/A, E, C (botulinum neurotoxin serotypes A, E, C) recognition sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Determining clostridial toxin protease activity, by treating sample with tagged toxin substrate comprising fluorescent protein, first and second partner of affinity couple and assaying fluorescent cleavage product in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
